

### When is a drum gripper used?

This attachment is usually deployed where the application is totally drum-based. The attachment can not only move the drums more efficiently than human beings, it can also rotate them into position. Also, depending on their size, multiple drums can be handled simultaneously. There are two types of the drum gripper: one grasps the body of the drum and is called "steel drum gripper" and the other attaches to the rim of the drum and is called "bean drum gripper".
